

PERCENTAGE

Importance : For percentage it may be mentioned that in every chapter of arithmetic, percentage based questions are asked, hence practice and expertise is essential. Moreover by solving percentage questions we get idea of many other basic concepts.

Scope of questions : Percentage, based questions are mainly arithmetic and from sale, purchase, Profit & Loss, Discount, Interest, Number system, Alligation, Reduction in cost, Population based chapters.

Way to success : Deep study of percentage is required with complete accuracy and rechecking habit. Rechecking of answers is must for this chapter.

IMPORTANT POINTS

Percentage : Percentage refers to "Per hundred" i.e., 8% means 8 out of hundred or $\frac{8}{100}$. Percentage is denoted by '%'.
a represented as the per cent of b as, $\frac{a}{b} \times 100$

$$b\% \text{ of } a = a \times \frac{b}{100}$$

To Convert a fraction/Decimal into percentage multiply it by 100.

$$\text{As } 0.35 = \frac{35}{100} = \frac{35}{100} \times 100\% = 35\%$$

To convert a per cent into fraction divide it by 100

$$\text{As } 12.5\% = \frac{12.5}{100} = \frac{1}{8}$$

Rule 1 : If x is reduced to x_0 , then,

$$\text{Reduce \%} = \frac{x - x_0}{x} \times 100$$

Rule 2 : If x is increased to x_1 , then,

$$\text{Increment\%} = \frac{x_1 - x}{x} \times 100$$

Rule 3 : If an amount is increased by a% and then it is reduced by a% again, then percentage change will be a decrease of $\frac{a^2}{100}\%$

Rule 4 : If a number is increased by a% and then it is decreased by b%, then resultant change in percentage will

$$\text{be } \left(a - b - \frac{ab}{100} \right)\%$$

(Negative for decrease, Positive for increase)

Rule 5 : If a number is decreased by a% and then it is increased by b%, then net increase or decrease per cent is

$$\left(-a + b - \frac{ab}{100} \right)\% \quad \begin{matrix} \text{(Negative sign for decrease)} \\ \text{(Positive sign for increase)} \end{matrix}$$

Rule 6 : If a number is first decreased by a% and then by b%, then net decrease per cent is $\left(-a - b + \frac{ab}{100} \right)\%$
(-ve sign for decrease)

Rule 7 : If a number is first increased by a% and then again increased by b%, then total increase per cent is

$$\left(a + b + \frac{ab}{100} \right)\%$$

Rule 8 : If the cost of an article is increased by A%, then how much to decrease the consumption of article, so that expenditure remains same is given by

OR

If the income of a man is A% more than another man, then income of another man is less in comparison to the 1st man by

$$\left(\frac{A}{(100 + A)} \times 100 \right)\%$$

Rule 9 : If the cost of an article is decreased by A%, then the increase in consumption of article to maintain the expenditure will be?

OR

If 'x' is A% less than 'y', then y is more than 'x' by

$$\text{Required\%} = \left(\frac{A}{(100 - A)} \times 100 \right)\% \text{ (increase)}$$

Rule 10 : If the length of a rectangle is increased by a% and breadth is increased by b%, then the area of rectangle will increase by

$$\text{Required Increase} = \left(a + b + \frac{ab}{100} \right)\%$$

Note: If a side is increased, take positive sign and if it is decreased, take negative sign. It is applied for two dimensional figures.

Rule 11 : If the side of a square is increased by a% then, its area will increase by

$$\left(2a + \frac{a^2}{100} \right)\% = \left(a + a + \frac{a \cdot a}{100} \right)\%$$

The above formula is also implemented for circle where radius is used as side. This formula is used for two dimensional geometrical figures having both length and breadth equal.

Rule 12 : If the side of a square is decreased by a%, then the area of square will decrease by

$$\therefore \text{Decrease} = \left(-2a + \frac{a^2}{100} \right)\%$$

This formula is also applicable for circles. where decrease % of radius is given.

Rule 13 : If the length, breadth and height of a cuboid are increased by a%, b% and c% respectively, then, Increase% in volume

$$= \left[a + b + c + \frac{ab + bc + ca}{100} + \frac{abc}{(100)^2} \right] \%$$

Rule 14 : If every side of cube is increased by a%, then increase % in volume

$$= \left(3a + \frac{3a^2}{100} + \frac{a^3}{(100)^2} \right) \%$$

This formula will also be used in calculating increase in volume of sphere, where increase in radius is given.

Rule 15 : If a% of a certain sum is taken by 1st man and b% of remaining sum is taken by 2nd man and finally c% of remaining sum is taken by 3rd man, then if 'x' rupee is the remaining amount then,

$$\text{Initial amount} = \frac{100 \times 100 \times 100 \times x}{(100 - a)(100 - b)(100 - c)}$$

Rule 16 : If an amount is increased by a% and then again increased by b% and finally increased by c%, So, that resultant amount is 'x' rupees, then,

$$\text{Initial amount} = \frac{100 \times 100 \times 100 \times x}{(100 + a)(100 + b)(100 + c)}$$

Rule 17 : If the population/cost of a certain town/article, is P and annual increment rate is r%, then

$$(i) \text{ After 't' years population/cost} = P \left(1 + \frac{r}{100} \right)^t$$

$$(ii) \text{ Before 't' years population/cost} = \frac{P}{\left(1 + \frac{r}{100} \right)^t}$$

Rule 18 : If the population/cost of a town/article is P and it decreases/reduces at the rate of r% annually, then,

$$(i) \text{ After 't' years population/cost} = P \left(1 - \frac{r}{100} \right)^t$$

$$(ii) \text{ Before 't' years population/cost} = \frac{P}{\left(1 - \frac{r}{100} \right)^t}$$

Rule 19 : On increasing/decreasing the cost of a certain article by x%, a person can buy 'a' kg article less/more in 'y' rupees, then

$$\text{Increased/decreased cost of the article} = \left(\frac{xy}{100 \times a} \right)$$

And initial cost

$$= \frac{xy}{(100 \pm x)a} \quad [\text{Negative sign when decreasing and positive sign when increasing}]$$

Rule 20 : If a person saves 'R' rupees after spending x% on food, y% on cloth and z% on entertainment of his income then,

$$\text{Monthly income} = \frac{100}{100 - (x + y + z)} \times R$$

Rule 21 : The amount of acid/milk is x% in 'M' litre mixture. How much water should be mixed in it so that percentage amount of acid/milk would be y%?

$$\text{Amount of water} = \frac{M(x - y)}{y}$$

Rule 22 : An examinee scored m% marks in an exam, and failed by p marks. In the same examination another examinee obtained n% marks and passed with q more marks than minimum, then

$$\therefore \text{Maximum marks} = \frac{100}{(n - m)} \times (p + q)$$

Rule 23 : In an examination, a% candidates failed in Maths and b% candidates failed in English. If c% candidate failed in both the subjects, then,

(i) Passed candidates in both the subjects

$$= 100 - (a + b - c)\%$$

(ii) Percentage of candidates who failed in either subject

$$= (a + b - c)\%$$

Rule 24 : In a certain examination passing marks is a%. If any candidate obtains 'b' marks and fails by 'c' marks, then,

$$\text{Total marks} = \frac{100(b + c)}{a}$$

Rule 25 : In a certain examination, 'B' boys and 'G' girls participated. b% of boys and g% of girls passed the examination, then,

Percentage of passed students of the total students =

$$\left(\frac{B.b + G.g}{B + G} \right) \%$$

Rule 26 : If a candidate got A% votes in a poll and he won or defeated by 'x' votes, then, what was the total no. of votes which was casted in poll ?

$$\therefore \text{Total no. of votes} = \frac{50 \times x}{(50 - A)}$$

Rule 27 : If a number 'a' is increased or decreased by

$$b\%, \text{ then the new number will be } \left(\frac{100 \pm b}{100} \right) \times a$$

Rule 28 : If the present population of a town is P and the population increases or decreases at rate of R₁%, R₂% and R₃% in first, second and third year respectively.

then the population of town after 3 years =

$$P \left(1 \pm \frac{R_1}{100} \right) \left(1 \pm \frac{R_2}{100} \right) \left(1 \pm \frac{R_3}{100} \right)$$

'+' is used when population increases

'-' is used when population decreases.

The above formula may be extended for n number of years.

⇒ Population after 'n' years

$$= P \left(1 \pm \frac{R_1}{100} \right) \left(1 \pm \frac{R_2}{100} \right) \dots \dots \dots \left(1 \pm \frac{R_n}{100} \right)$$

Rule 29 : If two numbers are respectively x% and y% less than the third number, first number as a percentage of

$$\text{second is } \frac{100 - x}{100 - y} \times 100\%$$

Rule 30 : If two numbers are respectively x% and y% more than a third number the first as percentage of second

$$\text{is } \frac{100 + x}{100 + y} \times 100\%$$

Rule 31 : If the price of an article is reduced by a% and buyer gets c kg more for some Rs. b, the new

$$\text{price per kg of article} = \frac{ab}{100 \times c}$$

EXPLANATIONS

TYPE-I

1. (3) According to question,

$$A \times \frac{80}{100} = B \times \frac{50}{100}$$

$$\therefore B = \frac{A \times 80}{50} = 1.6A$$

$$\therefore B = 160\% \text{ of } A$$

$$\therefore x = 160$$

2. (4) According to question,

$$y = \frac{100 \times 100}{80} \text{ of } x$$

$$\therefore y = 125\% \text{ of } x$$

3. (1) $\frac{8x}{100} = \frac{4y}{100}$

$$\Rightarrow y = 2x$$

$$\therefore 20\% \text{ of } x = 10\% \text{ of } y.$$

4. (4) Let x be the multiplicand.

$$\therefore \text{Error} = \frac{5}{3}x - \frac{3}{5}x$$

$$= \frac{25x - 9x}{15} = \frac{16x}{15}$$

$$\therefore \text{Percentage error}$$

$$= \frac{16x}{\frac{5}{3}x} \times 100 = \frac{15}{5} \times 100$$

$$= \frac{16x}{15} \times \frac{3}{5x} \times 100 = 64\%$$

5. (3) $p\%$ of $p = 36$

$$\Rightarrow \frac{p}{100} \times p = 36$$

$$\Rightarrow p^2 = 3600$$

$$\Rightarrow p = 60$$

6. (3) Let 2 be $x\%$ of 50

$$\Rightarrow x\% \text{ of } 50 = 2$$

$$\Rightarrow \frac{x}{100} \times 50 = 2 \Rightarrow \frac{x}{2} = 2$$

$$\therefore x = 4$$

7. (4) Let $x\%$ of $\frac{1}{3} = \frac{2}{3}$

$$\Rightarrow x\% = \frac{2 \times 3}{3} = 2 \Rightarrow x = 200\%$$

8. (1) 0.15% of $33\frac{1}{3}\%$ of ₹ 10000

$$= \frac{0.15}{100} \times \frac{100}{300} \times 10000 = ₹5$$

9. (2) 30% of $x = 72$

$$\therefore x = \frac{72 \times 100}{30} = 240$$

10. (4) 15% of $(A + B)$

$$= 25\% \text{ of } (A - B)$$

$$\Rightarrow \frac{15}{100}(A + B) = \frac{25}{100}(A - B)$$

$$\Rightarrow 15(A + B) = 25(A - B)$$

$$\Rightarrow 15A + 15B = 25A - 25B$$

$$\Rightarrow 10A = 40B$$

$$\Rightarrow A = 4B$$

$$\text{Now, let } x\% \text{ of } B \text{ is equal to } A$$

$$\therefore \frac{x}{100} \times B = A \Rightarrow \frac{x}{100} \times B = 4B$$

$$\therefore x = 400\%$$

11. (4) 20% of 25% of 300

$$= \frac{20}{100} \times \frac{25}{100} \times 300$$

$$= \frac{1}{5} \times \frac{1}{4} \times 300 = 15$$

12. (2) $x\%$ of $\frac{25}{2} = 150$

$$\Rightarrow \frac{x}{100} \times \frac{25}{2} = 150$$

$$\Rightarrow \frac{x}{8} = 150$$

$$\Rightarrow x = 150 \times 8 = 1200$$

13. (1) 50% of $(x - y)$

$$= 30\% \text{ of } (x + y)$$

$$\Rightarrow \frac{1}{2}(x - y) = \frac{3}{10}(x + y)$$

$$\Rightarrow \frac{x}{2} - \frac{3x}{10} = \frac{3}{10}y + \frac{y}{2}$$

$$\Rightarrow \frac{5x - 3x}{10} = \frac{3y + 5y}{10}$$

$$\Rightarrow \frac{x}{5} = \frac{4y}{5}$$

$$\therefore x = 4y$$

$$\Rightarrow y = \frac{x}{4} \text{ or } \frac{x}{4} \times 100\% = 25x$$

$$\text{Obviously, } y \text{ is } 25\% \text{ of } x$$

14. (3) $P \times \frac{50}{100} = Q \times \frac{25}{100}$

$$\Rightarrow P \times 50 = Q \times 25$$

$$\Rightarrow P = \frac{Q \times 25}{50} \Rightarrow P = \frac{Q}{2}$$

$$P = Q \times x\%$$

$$\therefore Q \times \frac{x}{100} = \frac{Q}{2}$$

$$\Rightarrow x = \frac{100}{2} = 50$$

15. (2) 20% of $A = 50\%$ of B

$$\Rightarrow 2A = 5B \Rightarrow A = \frac{5B}{2}$$

$$\text{Let } B \text{ is } x\% \text{ of } A.$$

$$\therefore \frac{5B}{2} \times \frac{x}{100} = B$$

$$\Rightarrow x = \frac{200}{5} = 40\%$$

16. (4) Since 18% of the students neither play football nor cricket. It means 82% of the students either play football or cricket or both.

Using set theory

$$\therefore n(A \cup B) = n(A) + n(B) - n(A \cap B)$$

$$\Rightarrow 82 = 40 + 50 - n(A \cap B)$$

$$\Rightarrow n(A \cap B) = 90 - 82 = 8$$

$$\therefore 8\% \text{ students play both games.}$$

17. (2) $\frac{20(P+Q)}{100} = \frac{50}{100}(P-Q)$

$$\Rightarrow \frac{P+Q}{P-Q} = \frac{5}{2}$$

$$\Rightarrow \frac{2P}{2Q} = \frac{5+2}{5-2}$$

[By componendo & dividendo]

$$\Rightarrow \frac{P}{Q} = \frac{7}{3} \text{ or } 7 : 3$$

18. (1) Let $x\% \times 0.1 = 0.01$

$$\Rightarrow \frac{x}{100} \times 0.1 = 0.01$$

$$\Rightarrow x = \frac{0.01 \times 100}{0.1} = 10$$

19. (1) Required percentage

$$= \frac{65}{2000} \times 100 = \frac{13}{4}$$

$$[\because 2\text{kg} = 2000\text{g}]$$

20. (3) $1\% = \frac{1}{100}$

$$\therefore \frac{1}{100} \times \frac{1}{2} = \frac{1}{200} = 0.005$$

21. (2) 1 hour 45 minutes

$$= 1\frac{3}{4} \text{ hours} = \frac{7}{4} \text{ hours}$$

$$1 \text{ day} = 24 \text{ hours}$$

$$\therefore \text{Required per cent}$$

$$\frac{7}{24} \times 100$$

$$= \frac{7}{4 \times 24} \times 100$$

$$= 7.292\%$$

22. (3) Required percentage

$$= \frac{1.14}{1.9} \times 100 = 60\%$$

23. (4) Required percentage

$$= \frac{32}{80} \times 100 = 40\%$$

24. (2) $A \times \frac{90}{100} = \frac{B \times 30}{100}$

$$\Rightarrow A \times 3 = B$$

$$\Rightarrow A \times x\% = A \times 3$$

$$\Rightarrow \frac{x}{100} = 3 \Rightarrow x = 300$$

25. (4) $\frac{A \times 90}{100} = \frac{B \times 30}{100}$

$$\Rightarrow 3A = B$$

$$\Rightarrow 3A = A \times \frac{2x}{100}$$

$$\Rightarrow 300 = 2x \Rightarrow x = 150$$

26. (4) $A \times \frac{30}{100} + \frac{B \times 40}{100} = \frac{B \times 80}{100}$

$$\Rightarrow A \times 30 = B \times 40$$

$$\Rightarrow \frac{A}{B} = \frac{40}{30} = \frac{4}{3}$$

$$\Rightarrow \frac{B}{A} = \frac{3}{4}$$

$$\Rightarrow \frac{B}{A} \times 100 = \frac{3}{4} \times 100 = 75\%$$

27. (1) $(A + B) \times \frac{40}{100}$

$$= (A - B) \times \frac{60}{100}$$

$$\Rightarrow 2(A + B) = 3(A - B)$$

$$\Rightarrow 2A + 2B = 3A - 3B$$

$$\Rightarrow A = 5B$$

$$\therefore \frac{2A - 3B}{A + B} = \frac{10B - 3B}{5B + B}$$

$$= \frac{7B}{6B} = \frac{7}{6}$$

28. (4) $0.1\% = \frac{0.1}{100} = 0.001$

29. (4) Required percentage

$$= \frac{70}{3.5 \times 1000} \times 100 = 2\%$$

30. (4) $\frac{1}{3}$ of 1206 = $1206 \times \frac{1}{3} = 402$

\therefore Required percent

$$= \frac{402}{134} \times 100 = 300\%$$

31. (1) $a \times \frac{120}{100} = b \times \frac{80}{100}$

$$\Rightarrow \frac{b}{a} = \frac{120}{80} = \frac{3}{2}$$

$$\therefore \frac{b+a}{b-a} = \frac{\frac{b}{a}+1}{\frac{b}{a}-1} = \frac{\frac{3}{2}+1}{\frac{3}{2}-1} = \frac{\frac{5}{2}}{\frac{1}{2}} = 5$$

32. (1) $(A + B) \times \frac{20}{100} = B \times \frac{50}{100}$

$$\Rightarrow \frac{A+B}{5} = \frac{B}{2}$$

$$\Rightarrow 2A + 2B = 5B$$

$$\Rightarrow 2A = 3B$$

$$\Rightarrow \frac{2A}{B} = 3 \text{ or } 2A = 3B$$

$$\therefore \frac{2A-B}{2A+B} = \frac{\frac{2A}{B}-1}{\frac{2A}{B}+1} = \frac{3-1}{3+1}$$

$$= \frac{2}{4} = \frac{1}{2} = \frac{3B-B}{3B+B} = \frac{2B}{4B}$$

33. (2) $\frac{ax}{100} = \frac{by}{100}$

$$\Rightarrow b = \frac{ax}{y}$$

$$\therefore z\% \text{ of } b = \frac{ax}{y} \times \frac{z}{100}$$

$$= \frac{xz}{y} \% \text{ of } a$$

34. (1) $60 \times 60 \times \frac{y}{100}$

$$= 1 \text{ minute } 12 \text{ seconds}$$

$$\Rightarrow 36y = 72 \Rightarrow y = 2$$

35. (4) Required percentage

$$= \frac{72}{3.6 \times 1000} \times 100 = 2\%$$

36. (3) Let the total number of employees be x .

$$\therefore x \times \frac{69}{100} = 20700$$

$$\Rightarrow x = \frac{20700 \times 100}{69} = 30000$$

37. (3) Required percentage

$$= \frac{24}{40} \times 100 = 60\%$$

38. (1) $x \times \frac{125}{100} = 100$

$$\Rightarrow x = \frac{100 \times 100}{125} = 80$$

39. (3) $x \times \frac{83}{100} = 498$

$$\Rightarrow x = \frac{498 \times 100}{83} = 600$$

40. (4) Let $C = 100$

Then, $A = 150$

$B = 125$

\therefore Required percentage

$$= \frac{150 - 125}{125} \times 100 = 20\%$$

41. (2) If the number of trees in the garden be x , then

$$x \times \frac{60}{100} \times \frac{25}{100} \times \frac{20}{100} = 1500$$

$$\Rightarrow x \times \frac{3}{5} \times \frac{1}{4} \times \frac{1}{5} = 1500$$

$$\Rightarrow x = \frac{1500 \times 5 \times 4 \times 5}{3}$$

$$= 50000$$

42. (2) Males = $25000 \times \frac{4}{5} = 20000$

Females = 5000

Educated males

$$= 20000 \times \frac{95}{100} = 19000$$

Educated females

$$= \frac{5000 \times 60}{100} = 3000$$

Total educated persons

$$= 22000$$

\therefore Required per cent

$$= \frac{22000}{25000} \times 100 = 88\%$$

43. (4) Required number

$$= \frac{240 \times 25}{100} - \frac{160 \times 15}{100}$$

$$= 60 - 24 = 36$$

44. (3) First part = ₹ x and second part = ₹ y .

$$\therefore \frac{x \times 80}{100} = \frac{y \times 60}{100} + 3$$

$$\Rightarrow \frac{4x}{5} = \frac{3y}{5} + 3$$

$$\Rightarrow 4x - 3y = 15 \quad \dots(i)$$

Again,

$$\frac{4y}{5} = \frac{9x}{10} + 6$$

$$\Rightarrow 8y = 9x + 60$$

$$\Rightarrow 8y - 9x = 60 \quad \dots(ii)$$

By equation (i) $\times 8$ + (ii) $\times 3$,

$$32x - 24y = 120$$

$$24y - 27x = 180$$

$$5x = 300 \Rightarrow x = 60$$

From equation (i)

$$4 \times 60 - 3y = 15$$

$$\Rightarrow 3y = 240 - 15 = 225$$

$$\Rightarrow y = \frac{225}{3} = 75$$

$$\therefore x + y = 60 + 75 = 135$$

45. (3) Group A = 40%

$$\text{Group B} = \frac{60 \times 75}{100} = 45\%$$

Group C = 15%

If the total number of students be x , then

$$\frac{x \times 15}{100} = 12$$

$$\Rightarrow x = \frac{12 \times 100}{15} = 80$$

46. (3) After taking away respective balls,

Number of balls in the box

$$= 75 + 25 + 50 = 150$$

\therefore Percentage of black balls

$$= \frac{50}{150} \times 100$$

$$= \frac{100}{3} = 33\frac{1}{3}\%$$

47. (2) \therefore S.P. of a dozen pairs of socks

$$= \frac{180 \times 80}{100} = ₹ 144$$

\therefore S.P. of 1 pair of socks

$$= \frac{144}{12} = ₹ 12$$

\therefore No of pairs available for

$$₹ 48 = \frac{48}{12} = 4$$

48. (1) Let the number be x .

$$\therefore \frac{3}{5} \times \frac{60}{100} \times x = 36$$

$$\Rightarrow x = \frac{36 \times 5 \times 5}{3 \times 3} = 100$$

$$49. (2) \frac{P - Q}{2} = (P + Q) \times \frac{30}{100}$$

$$\Rightarrow 5(P - Q) = (P + Q) \times 3$$

$$\Rightarrow 5P - 3P = 5Q + 3Q$$

$$\Rightarrow 2P = 8Q$$

$$\Rightarrow P = 4Q = 4 \times \frac{P \times x}{100}$$

$$\Rightarrow \frac{4x}{100} = 1 \Rightarrow x = 25$$

50. (3) Let greater number be x .

\therefore Smaller number = $150 - x$

According to the question,

$$\frac{40 \times x}{100} = \frac{60(150 - x)}{100}$$

$$\Rightarrow 2x = 3 \times 150 - 3x$$

$$\Rightarrow 5x = 3 \times 150$$

$$\Rightarrow x = 90$$

51. (3) Let the number be x . According to the question

$$80\% \text{ of } x + 80 = x$$

$$\Rightarrow \frac{80x}{100} + 80 = x$$

$$\Rightarrow \frac{4x}{5} + 80 = x$$

$$\Rightarrow \frac{x}{5} = 80 \Rightarrow x = 400$$

52. (4) Suppose number be x

$$20\% \text{ of } x = 120$$

$$x \times \frac{20}{100} = 120$$

$$x = \frac{120 \times 100}{20} = 600$$

$$600 \times 120\% = 600 \times \frac{120}{100} = 720$$

53. (2) Let the number be x . Then

$$x - 60\% \text{ of } x = 60$$

$$\Rightarrow x - 0.60x = 60$$

$$\Rightarrow 0.4x = 60$$

$$\Rightarrow x = \frac{60}{0.4} \Rightarrow x = \frac{600}{4}$$

$$x = 150$$

\therefore The number is 150

54. (3) Let number be x .

\therefore According to question,

$$75\% \text{ of } x + 75 = x$$

$$\frac{3x}{4} + 75 = x \Rightarrow x - \frac{3x}{4} = 75$$

$$x = 75 \times 4 = 300$$

55. (4) Let the third number be x ,
According to the question;

$$\text{First number} = \frac{20}{100} \times x = \frac{x}{5}$$

$$\text{Second number} = \frac{50}{100} \times x = \frac{x}{2}$$

\therefore Required percentage

$$= \frac{\frac{x}{5} \times 100}{\frac{x}{2}} = \frac{x}{5} \times \frac{2}{x} \times 100 = 40\%$$

56. (4) **Rule :** If two numbers are respectively $x\%$ and $y\%$ less than the third number, first number as a percentage of

$$\text{second is } \frac{100 - x}{100 - y} \times 100\%$$

\therefore Required percentage

$$= \frac{100 - 25}{100 - 20} \times 100\%$$

$$= \frac{75}{80} \times 100\% = 93.75\%$$

57. (4) According to question

$$x + \frac{x \times 150}{100} = 150$$

$$\Rightarrow x + \frac{3}{2}x = 150$$

$$\Rightarrow 2x + 3x = 2 \times 150 = 300$$

$$\Rightarrow 5x = 300 \Rightarrow x = 60$$

58. (1) Let the number be x .

According to the question,

$$x \times \frac{18}{100} = 75 \times \frac{12}{100}$$

$$\Rightarrow x = \frac{75 \times 12}{18} = 50$$

59. (2) Let the numbers be x and y and $x > y$.

According to the question,

$$6\frac{1}{2}\% \text{ of } x = 8\frac{1}{2}\% \text{ of } y$$

$$\text{or } \frac{13}{2}\% \text{ of } x = \frac{17}{2}\% \text{ of } y$$

$$\text{or } 13x = 17y$$

$$\text{or } x = \frac{17}{13}y$$

$$\therefore \frac{17}{13}y - y = 1660$$

$$\text{or } \frac{17y - 13y}{13} = 1660$$

$$\text{or } 4y = 1660 \times 13$$

$$\text{or } y = \frac{1660 \times 13}{4} = 5395$$

60. (3) If the number be x , then

$$x \times \frac{75}{100} + 75 = x$$

$$\Rightarrow \frac{3x}{4} + 75 = x$$

$$\Rightarrow x - \frac{3x}{4} = 75$$

$$\Rightarrow \frac{x}{4} = 75$$

$$\Rightarrow x = 4 \times 75 = 300$$

$$\therefore 40\% \text{ of } 300$$

Remaining sum

$$= \text{Rs. } (80 - 24) = \text{Rs. } 56$$

Sum given to the trust

$$= 10\% \text{ of ₹ } 56 = ₹ 5.6$$

\therefore Remaining sum

$$= ₹ (56 - 5.6) = ₹ 50.4$$

\therefore When ₹ 50.4 remains, total income = ₹ 100

\therefore When ₹ 10080 remains, total income

$$= \frac{100 \times 10080}{50.4} = ₹ 20000$$

Aliter : Using Rule 20,

Here, $R = ₹ 10080$

$$x = 20\%,$$

$$y = 30\%$$

$$\text{Her total salary} = \frac{1500 \times 100}{20}$$

Average monthly income

$$= \frac{25 \times x}{200} = \frac{x}{8}$$

So, remaining amount

$$= \frac{70x - 21x}{80} = ₹ \frac{49x}{80}$$

According to the question,

$$\therefore \frac{49x}{80} = 2940$$

$$\Rightarrow x = \frac{2940 \times 80}{49}$$

$$= ₹ 4800$$

Aliter : Using Rule 20,

His salary

$$= \frac{100 \times 2940}{100 - \left(\frac{25}{2} + 26.25 \right)}$$

$$\therefore \text{Ram's savings}$$

$$= \frac{14 \times 7000}{100} = ₹ 980$$

$$= \frac{480 - 345}{4} = ₹ \frac{135}{4}$$

Increase in savings

Remaining amount

$$= \frac{3x}{5} - \frac{x}{5} = \frac{2x}{5}$$

According to question

According to the question,

$$\frac{5200 \times x + 4200 \times y}{x + y} = 5000$$

$$\Rightarrow 52x + 42y = 50(x + y)$$

TYPE-IV

1. (1) Let B = 100

∴ According to question,
A is 40% greater than B.

$$\therefore A = 140$$

∴ B is 20% less than C

$$\therefore 0.8C = 100$$

$$\therefore C = 125$$

$$\therefore A : C = 140 : 125 = 28 : 25$$

2. (1) 10% of m = 20% of n

$$\Rightarrow \frac{10}{100} \times m = \frac{20}{100} \times n$$

$$\Rightarrow \frac{m}{n} = \frac{10}{5} = \frac{2}{1}$$

$$\therefore m : n = 2 : 1$$

3. (1) 5 : 4 when expressed as per

$$\text{cent} = \frac{5}{4} \times 100 = 125\%$$

4. (3) Let the number of boys and girls in the college be $3x$ and $2x$ respectively. Number of minor boys

$$= 3x \times \frac{80}{100} = \frac{12x}{5}$$

Number of minor girls

$$= 2x \times \frac{75}{100} = \frac{3x}{2}$$

Total number of minor students

$$= \frac{12x}{5} + \frac{3x}{2}$$

$$= \frac{24x + 15x}{10} = \frac{39x}{10}$$

Required percentage

$$= \frac{39x}{10 \times 5x} \times 100 = 78\%$$

(As total students = $3x + 2x$)

5. (4) Let the number of boys and girls be $4x$ and x respectively. Number of boys who hold scholarship.

$$= \frac{75}{100} \times 4x = 3x$$

and number of girls who hold scholarship

$$= \frac{70 \times x}{100} = \frac{7x}{10}$$

Number of students who do not hold scholarship

$$= 5x - 3x - \frac{7x}{10} = 2x - \frac{7x}{10}$$

$$= \frac{20x - 7x}{10} = \frac{13x}{10}$$

The required percentage

$$= \frac{13x}{10} \times 100$$

$$= \frac{13x}{10 \times 5x} \times 100 = 26\%$$

6. (1) Let the numbers be $2x$ and $3x$.

According to the question,

$$\left(\frac{20}{100} \times 2x \right) + 20$$

$$= \left(\frac{10}{100} \times 3x \right) + 25$$

$$\Rightarrow \frac{2x}{5} + 20 = \frac{3x}{10} + 25$$

$$\Rightarrow \frac{2x}{5} - \frac{3x}{10} = 25 - 20$$

$$\Rightarrow \frac{4x - 3x}{10} = 5 \Rightarrow x = 50$$

∴ The smaller number

$$= 2x = 100$$

7. (3) Let the third number be 100.

∴ First number = 120

Second number = 150

∴ Required ratio

$$= \frac{120}{150} = \frac{4}{5} \text{ or } 4 : 5$$

8. (3) Let the numbers be x and y and x is greater than y . Then

$$x - y = 45\% \text{ of } (x + y)$$

$$\Rightarrow x - y = \frac{45}{100}(x + y)$$

$$\Rightarrow x - y = \frac{9}{20}(x + y)$$

$$\Rightarrow 20x - 20y = 9x + 9y$$

$$\Rightarrow 20x - 9x = 20y + 9y$$

$$\Rightarrow 11x = 29y$$

$$\Rightarrow \frac{x}{y} = \frac{29}{11}$$

or 29 : 11

9. (4) 30% of A = 25% of B

$$\Rightarrow 30A = 25B$$

$$\Rightarrow A : B = 25 : 30 = 5 : 6$$

Again,

$$25\% \text{ of } B = 20\% \text{ of } C$$

$$\Rightarrow 25B = 20C$$

$$\Rightarrow 5B = 4C$$

$$\Rightarrow B : C = 4 : 5$$

$$\therefore A : B : C = 5 \times 4 : 4 \times 6 : 6 \times 5$$

$$= 20 : 24 : 30 = 10 : 12 : 15$$

10. (2) Let number of boys be x .

$$\text{Then, } x + \frac{120}{100}x = 66$$

$$\Rightarrow x + \frac{6x}{5} = 66$$

$$\Rightarrow \frac{5x + 6x}{5} = 66$$

$$\Rightarrow x = \frac{66 \times 5}{11} = 30$$

∴ Number of girls

$$= 66 - 30 = 36$$

∴ New ratio = 30 : (36 + 4)

$$= 30 : 40 = 3 : 4$$

11. (4) Let the number of boys = $3x$ and that of girls = $2x$
Number of boys who do not hold scholarship = 80% of $3x$

$$= 3x \times \frac{80}{100} = \frac{12x}{5}$$

Number of girls who do not hold scholarship

$$= 2x \times \frac{70}{100} = \frac{14x}{10}$$

∴ Number of students who do not hold scholarship

$$= \frac{12x}{5} + \frac{14x}{10} = \frac{24x + 14x}{10}$$

$$= \frac{38x}{10}$$

∴ Required percentage

$$= ₹ 32x$$

After increase,

Expenditure on rice

$$= \frac{120}{100} \times 12x = ₹ 14.4x$$

Expenditure on fish

$$= \frac{130}{100} \times 17x = ₹ 22.1x$$

Expenditure on oil

$$= \frac{150}{100} \times 3x = ₹ 4.5x$$

Total expenditure

$$= ₹ (14.4x + 22.1x + 4.5x)$$

$$= ₹ 41x$$

$$\text{Increase} = ₹ (41x - 32x)$$

$$= ₹ 9x$$

∴ Percentage increase

$$= \frac{9x}{32x} \times 100 = \frac{225}{8} = 28\frac{1}{8}\%$$

$$\Rightarrow \frac{A}{5} = \frac{B}{10} = \frac{C}{6} = k \text{ (let)}$$

$$\Rightarrow A = 5k, B = \frac{10}{3}k, C = 6k$$

$$= \frac{1090}{2000} \times 100 = 54.5\%$$

Aliter : Using Rule 25,
B = 1100, b = 50%, G = 900, g = 40%

Percentage of failed candidates

$$= \frac{(Bb + Gg)}{B + G} \%$$

$$= \frac{1100 \times 50 + 900 \times 40}{1100 + 900}$$

$$= \frac{55000 + 36000}{2000}$$

$$= \frac{91}{2} = 45.5\%$$

15. (2) Successful boys in English or Maths or both

$$= 80 + 85 - 75 = 90\%$$

Unsuccessful boys = 10%

\therefore Total number of boys

$$= \frac{100}{10} \times 45 = 450$$

16. (2) 25% of students pass in at least one subject i.e.; they pass in one or both subjects.

\therefore % of students who don't pass or fail in both subjects

$$= (100 - 25)\% = 75\%$$

17. (1) The percentage of students who pass in one or two or both subjects

$$= 60 + 70 - 40 = 90$$

\therefore Percentage of failed students = 100 - 90 = 10%

18. (3) Let total number of candidates = 100

70 candidates passed in English and 30 failed in it.

80 candidates passed in Maths and 20 failed in it.

10 candidates failed in English and Maths both.

\therefore Out of 30 failed in English, 10 failed in Maths also.

\therefore 30 - 10 = 20 failed in English alone.

Similarly,

20 - 10 = 10 failed in Maths alone.

\therefore Total number of failures

$$= 20 + 10 + 10 = 40$$

\therefore 100 - 40 = 60 candidates passed in both subjects.

Now, if 60 candidates pass, total strength = 100

\therefore For 144 candidates, total

$$\text{strength} = \frac{100}{60} \times 144 = 240$$

19. (4) Difference of percentages of maximum marks obtained by two candidates = $32\% - 20\% = 12\%$
 Difference of scores between two candidates = $30 + 42 = 72$
 \therefore 12% of maximum marks = 72
 \therefore Maximum marks

$$= \frac{72 \times 100}{12} = 600$$

\therefore Pass marks = 20% of 600 + 30
 = $120 + 30 = 150$
 \therefore Required percentage

$$= \frac{150}{600} \times 100 = 25\%$$

Aliter : Using Rule 22,
 $n = 32\%$, $m = 20\%$, $p = 30$, $q = 42$.

$$\text{Full Marks} = \frac{100}{n - m} \times (p + q)$$

$$= \frac{100}{(32 - 20)} \times (30 + 42)$$

$$= \frac{100}{32} \times 72 = 600$$

Pass marks = 20% of 600 + 30
 = $120 + 30 = 150$

\therefore Required percentage

$$= \frac{150}{600} \times 100 = 25\%$$

20. (4) Total number of students = $640 + 360 = 1000$
 Number of successful boys = 60% of 640 = 384
 Number of successful girls = 80% of 360 = 288
 Total number of successful students = $384 + 288 = 672$
 Number of unsuccessful students = $1000 - 672 = 328$
 \therefore Required percentage

$$= \frac{328 \times 100}{1000} = 32.8\%$$

Aliter : Using Rule 25,
 $B = 640$, $G = 360$,
 $b = 60\%$, $g = 80\%$
 Percentage of passed students

$$= \left(\frac{Bb + Gg}{B + G} \right) \%$$

$$= \frac{640 \times 60 + 360 \times 80}{640 + 360}$$

$$= \frac{38400 + 28800}{1000}$$

$$= \frac{67200}{1000} = 67.2\%$$

\therefore % of failed students
 = $100 - 67.2\%$
 = 32.8%

21. (3) Let total number of students = 100

Number of failures in Maths = 34
 Number of failures in English = 42
 Number of failures in both subjects = 20

Number of failures in Maths or English or both

$$= 34 + 42 - 20 = 56$$

Number of students who passed in both subjects

$$= 100 - 56 = 44$$

The required percentage = 44%

Aliter : Using Rule 23,

$a = 34\%$, $b = 42\%$, $c = 20\%$

Passed candidates in both the subjects

$$= 100 - (a + b - c)$$

$$= 100 - (34 + 42 - 20)$$

$$= 100 - 56 = 44\%$$

22. (2) Difference of percentage

$$= (40 - 30)\% = 10\%$$

Difference of marks = $6 + 6 = 12$

\therefore 10% of total marks = 12

$$\text{Total marks} = \frac{12 \times 100}{10} = 120$$

Aliter : Using Rule 22,

Here, $m = 30\%$, $n = 40\%$,

$$p = 6$$
, $q = 6$.

\therefore Maximum Marks

$$= \frac{100}{(n - m)} \times (p + q)$$

$$= \frac{100}{(40 - 30)} \times (6 + 6)$$

$$= \frac{100}{10} \times 12 = 120$$

23. (3) Let the total number of students = 100

\therefore Number of students who failed in Hindi or English or both

$$= 52 + 42 - 17 = 77$$

\therefore Number of students who passed in both subjects

$$= 100 - 77 = 23\%$$

\therefore Required percentage = 23

Aliter : Using Rule 23,

$a = 52\%$, $b = 42\%$, $c = 17\%$

Passed candidates

$$= 100 - (52 + 42 - 17)$$

$$= 100 - (94 - 17)$$

$$= 100 - 77 = 23\%$$

24. (2) Let total number of students = 100

\therefore 27 students speak none of the two languages.

It means only 73 students speak either Hindi or English or both.

Let x students speak both languages.

$$\therefore 73 = 70 - x + x + 65 - x$$

$$\Rightarrow x = 70 + 65 - 73 = 62\%$$

25. (2) Clearly, 75 candidates qualify

\therefore 75% of appearing candidates = 450

\therefore Number of appearing candidates

$$= \frac{450 \times 100}{75} = 600$$

26. (1) Number of students passed in first year = 75

Number of students passed in

$$\text{second year} = \frac{60 \times 75}{100} = 45$$

Total number of passed students = $75 + 45 = 120$

Total number of appeared students = 175

\therefore Required percentage

$$= \frac{120}{175} \times 100 = 68\frac{4}{7}\%$$

27. (4) Let the maximum marks be x .

According to the question,

$$35\% \text{ of } x = 200 + 10$$

$$\Rightarrow \frac{35x}{100} = 210$$

$$\Rightarrow x = \frac{210 \times 100}{35} = 600$$

Aliter : Using Rule 24,

$a = 35\%$, $b = 200$, $c = 10$

Maximum Marks

$$= \frac{100 \times (b + c)}{a}$$

$$= \frac{100(200 + 10)}{35}$$

$$= 600 \text{ Marks}$$

- 28.** (1) Let the full marks in that examination were x .

$$\Rightarrow \frac{x}{10} = 15$$

$$\therefore x = 150$$

\therefore Minimum pass marks

$$\frac{30}{100} \times 150 + 5 = 50$$

Aliter : Using Rule 22,

$m = 30\%$, $n = 40\%$,

$p = 5$, $q = 10$.

Maximum marks

$$= \frac{100}{(n - m)} \times (p + q)$$

$$= \frac{100}{(40 - 30)} \times (5 + 10) = 150$$

$$= x - 0.2x = 0.8x$$

$$\therefore 0.6x + 0.7x - 2500 = 0.8x$$

$$\Rightarrow 1.3x - 0.8x = 2500$$

$$\text{Second subject} \Rightarrow \frac{700 \times 80}{100}$$

$$= 560$$

$$\text{Total marks scored} = 648 + 560 = 1208$$

Total maximum marks

$$= 900 + 700 = 1600$$

∴ Required per cent

$$= \frac{1208}{1600} \times 100 = 75.5\%$$

50. (4) Percentage of failures either in 1 subject or both subjects = (35 + 45 - 20)% = 60%

$$\therefore \text{Percentage of the successful} = (100 - 60)\% = 40\%$$

51. (3) Total marks of 50 students = 50 × 70 = 3500

$$\text{Total marks of 25 students} = 25 \times 60 = 1500$$

$$\text{Total marks of 24 students} = 24 \times 80 = 1920$$

$$= 24 \times 80 = 1920$$

∴ Marks obtained by last student

$$= 3500 - 1500 - 1920$$

$$= 80 \text{ i.e., } 80\%$$

52. (3) Let marks obtained by the first student be x .

∴ Marks obtained by the second student = $x - 9$

According to the question,

$$x = 56\% \text{ of } (x + x - 9)$$

$$\Rightarrow x = \frac{(2x - 9) \times 56}{100}$$

$$\Rightarrow 100x = 112x - 504$$

$$\Rightarrow 112x - 100x = 504$$

$$\Rightarrow 12x = 504$$

$$\Rightarrow x = \frac{504}{12} = 42$$

∴ Marks obtained by the second student = 42 - 9 = 33

53. (3) Maximum marks of examination = x (let)

According to the question,

$$25\% \text{ of } x = 47 + 43$$

Positive sign shows increase.

13. (3) Using Rule 7,
Net effect

$$= \left(x + y + \frac{xy}{100} \right) \%$$

$$= \left(10 - 10 - \frac{10 \times 10}{100} \right) \% = -1\%$$

Negative sign shows decrease.

14. (4) Using Rule 5,

$$\Rightarrow \frac{x}{y} = \frac{4}{5} \times \frac{4}{6} = \frac{8}{15}$$

17. (3) Let original fraction be $\frac{x}{y}$

According to the question,

$$\frac{\frac{120}{100}x}{\frac{95y}{100}} = \frac{5}{2} \Rightarrow \frac{120x}{95y} = \frac{5}{2}$$

$$\Rightarrow \frac{x}{y} = \frac{5}{2} \times \frac{95}{120} = \frac{95}{48}$$

18. (2) Using Rule 4,

19. (3) Larger number = x and smaller number = $520 - x$

$$\therefore \frac{96x}{100} = \frac{(520 - x)}{100} \times 112$$

$$\Rightarrow 96x = 520 \times 112 - 112x$$

$$\Rightarrow 112x + 96x = 520 \times 112$$

$$\Rightarrow 208x = 520 \times 112$$

$$\Rightarrow x = \frac{520 \times 112}{208} = 280$$

$$\therefore \text{Smaller number} = 520 - 280 = 240$$

20. (3) If the original price of article be ₹ x , then

Aliter : Using Rule 5,

Let the number be x

The number increases by

$$\left(-20 + 30 - \frac{20 \times 30}{100} \right) \% = 4\%$$

$$\frac{104x}{100} = 416$$

$$\boxed{x = 400}$$

21. (3) If the number be x , then

$$x \times \frac{245}{200} = 98$$

Number of uncast votes = 8

∴ Number of votes polled = 92

Number of votes obtained by the winner = 48

∴ Number of votes obtained by the loser = 92 - 48 = 44

If the difference of win be 4 votes, total voters = 100

∴ When the difference be 1100 votes, total voters

$$= \frac{100}{4} \times 1100 = 27500$$

Aliter : Using Rule 21,
Here, $x = 1100$, $A = 48$

∴ Total number of votes

$$= \frac{50 \times 1100}{2}$$

$$= 25 \times 1100 = 27500$$

2. (3) Let the total number of voters enrolled be x .

Number of votes polled

$$= 75\% \text{ of } x = \frac{3x}{4}$$

Number of valid votes

$$= \frac{3x}{4} - \frac{2}{100} \times \frac{3x}{4} = \frac{3x}{4} - \frac{3x}{200}$$

$$= \frac{147x}{200}$$

$$\text{Now, } 75\% \text{ of } \frac{147x}{200} = 9261$$

$$\text{or } x = \frac{9261 \times 4 \times 200}{3 \times 147} = 16800$$

3. (3) Difference of percentage of votes = 60% - 40% = 20%

∴ 20% of total votes = 14000

$$\therefore x \times \left(\frac{60 - 40}{100} \right) = 298$$

6. (4) Number of valid votes

$$= 104000 \times \frac{98}{100} = 101920$$

(-ve sign will be neglected)

8. (2) Vote percentage of third candidate

$$= 100 - 40 - 36 = 24\%$$

Total number of votes

$$= \frac{50 \times 42000}{50 - 57}$$

$$= \frac{50 \times 42000}{-7} = 300000$$

(-ve sign will be neglected)

$$= \frac{50 \times 476}{34}$$

(-ve sign will be neglected)

$$= 700$$

11. (4) Number of valid votes = x (let)

∴ (62 - 38)% of $x = 7200$

$$\Rightarrow x \times \frac{24}{100} = 7200$$

$$\Rightarrow x = \frac{7200 \times 100}{24} = 30000$$

Aliter : Using Rule 26,
Total number of votes

$$= \frac{50 \times 7200}{(50 - 38)}$$

$$= 50 \times 600 = 30000$$

12. (2) Total number of votes polled = x (let)

According to the question,

$$\Rightarrow \frac{24x}{100} = 144$$

$$\Rightarrow 24x = 144 \times 100$$

$$\Rightarrow x = \frac{144 \times 100}{24} = 600$$

Aliter : Using Rule 26,

Total number of votes

$$= \frac{50 \times 144}{(50 - 62)}$$

$$= \frac{50 \times 144}{12}$$

(-ve sign will be neglected)
= 600

13. (2) Total voters in the list = x

Votes got by the winner

$$= \frac{47x}{100}$$

Votes got by the loser

$$= x - \frac{x}{10} - 60 - \frac{47x}{100}$$

$$= \frac{9x}{10} - \frac{47x}{100} - 60$$

$$= \frac{90x - 47x}{100} - 60$$

$$= \frac{43x}{100} - 60$$

According to the question,

$$\frac{47x}{100} - \frac{43x}{100} + 60 = 308$$

$$\Rightarrow \frac{4x}{100} = 308 - 60 = 248$$

$$\Rightarrow x = \frac{248 \times 100}{4} = 6200$$

14. (2) Total votes polled = x

According to the question,
(60 - 40)% of x = 298

$$\Rightarrow x \times \frac{20}{100} = 298$$

$$\Rightarrow \frac{x}{5} = 298$$

$$\Rightarrow x = 298 \times 5 = 1490$$

$$= (100 - 62)\% \text{ of } 1500$$

$$= \frac{1500 \times 38}{100} = 570$$

- 17.** (3) Using Rule 18,

Let the original price of the article be ₹ x .

According to the question,

$$5832 = x \left(1 - \frac{10}{100} \right)^3$$

$$\Rightarrow 5832 = x \times \left(\frac{9}{10}\right)^3$$

$$x = \frac{5832 \times 10 \times 10 \times 10}{9 \times 9 \times 9}$$

$$= ₹ 8000$$

18. (4)

Increase in AC = 6%

$$\therefore \text{Increased AC} = \frac{106}{100} \times 3$$

$$= 3.18 \text{ cm}$$

$$\therefore \text{Decreased CB} = 5 - 3.18$$

$$= 1.82 \text{ cm.}$$

$$\therefore \text{Decrease} = 2 - 1.82$$

$$= 0.18 \text{ cm}$$

$$\therefore \text{Percentage decrease}$$

$$= \frac{0.18}{2} \times 100 = 9\%$$

19. (2) $\therefore 24 = 100\%$

$$\therefore 22 = \frac{100}{24} \times 22 = 91\frac{2}{3}\%$$

20. (1) Let the number of boys be x and that of girls be y .

$$\text{Then, } 71x + 73y = 71.8(x + y)$$

$$\Rightarrow 71.8x - 71x = 73y - 71.8y$$

$$\Rightarrow 0.8x = 1.2y$$

$$\Rightarrow \frac{x}{y} = \frac{1.2}{0.8} = \frac{12}{8} = \frac{3}{2}$$

$$\therefore \frac{x}{y} + 1 = \frac{3}{2} + 1 \Rightarrow \frac{x+y}{y} = \frac{5}{2}$$

\therefore Percentage of girls

$$= \frac{y}{x+y} \times 100 = \frac{2}{5} \times 100 = 40\%$$

21. (2) Let the number of books in shelf B be 100.

$$\therefore \text{Number of books in shelf A} = 80$$

On transferring 25% i.e. $\frac{1}{4}$ of

books of shelf A to shelf B.

$$B = 100 + 20 = 120$$

Again, on transferring $\frac{1}{4}$ of books of shelf B to shelf A.

$$A = 60 + \frac{120}{4} = 90$$

\therefore Required percentage

$$= \frac{90}{180} \times 100 = 50\%$$

22. (2) Total revenue earned

$$= ₹ \left(9900 \times \frac{20}{100} \times 10 + 9900 \times \frac{80}{100} \times 20 \right)$$

$$= ₹ (19800 + 158400)$$

$$= ₹ 178200$$

23. (2) Let Tina's weight = 1 kg

Lina's weight = 2 kg

Neha's weight = 1.4 kg

Mina's weight = 1.8 kg.

$$\therefore \frac{1.8x}{100} = 1.4$$

$$\Rightarrow x = \frac{1.4 \times 100}{1.8} = \frac{700}{9} = 77\frac{7}{9}$$

24. (1) Let the number of seats initially in the cinema hall be 100 and the cost of each ticket be ₹ 100.

$$\therefore \text{Total revenue} = 100 \times 100$$

$$= ₹ 10000$$

In second condition,

Number of seats = 125

Cost of each ticket = ₹ 110

\therefore New revenue

$$= 125 \times 110 = ₹ 13750$$

Increase in revenue collection

$$= ₹. (13750 - 10000) = ₹ 3750$$

\therefore Percentage increase

$$= \frac{3750}{10000} \times 100 = 37.5\%$$

Aliter : % Increase in revenue

$$= \left(x + y + \frac{xy}{100} \right) \%$$

$$= \left(25 + 10 + \frac{25 \times 10}{100} \right) \% = 37.5\%$$

25. (4) Total amount = ₹ x

$$\therefore x - \frac{x}{5} - \frac{4x}{5} \times \frac{5}{100} = 120$$

$$= 1400$$

$$\Rightarrow x - \frac{x}{5} - \frac{x}{25} = 1520$$

$$\Rightarrow \frac{25x - 5x - x}{25} = 1520$$

$$\Rightarrow \frac{19x}{25} = 1520$$

$$\Rightarrow x = \frac{1520 \times 25}{19} = ₹ 2000$$

\therefore Expenditure on transport

$$= \frac{1}{25} \times 2000 = ₹ 80$$

26. (3) Let the total number of employees be x .

$$\therefore x \times \frac{69}{100} = 20700$$

$$\Rightarrow x = \frac{20700 \times 100}{69} = 30000$$

27. (4) Let the fruit seller had originally x apples.

According to the question;

$$x - 40\% \text{ of } x = 420$$

$$\Rightarrow x - \frac{40}{100} \times x = 420$$

$$\Rightarrow x - \frac{2x}{5} = 420$$

$$\Rightarrow \frac{5x - 2x}{5} = 420$$

$$\Rightarrow \frac{3x}{5} = 420$$

$$\therefore x = \frac{420 \times 5}{3} = 700$$

Method-2 :

60% = 420 (Directly)

$$\therefore 100\% = 420 \times \frac{100}{60} = 700$$

28. (3) Let third number = 100

First number = 120

Second number = 150

Required percentage

$$= \frac{120}{150} \times 100 = 80\%$$

Aliter : Using Rule 30,
Required percentage

$$= \left(\frac{100 + 20}{100 + 50} \right) \times 100\%$$

$$= \frac{120}{150} \times 100\%$$

$$= \frac{4}{5} \times 100\%$$

$$= 80\%$$

29. (2) The batsman scored $3 \times 4 + 8 \times 6 = 60$ runs by boundaries and sixes respectively. Then,

Runs scored by running

$$= 110 - 60 = 50$$

\therefore Required percentage

$$= \frac{50}{110} \times 100 = \frac{500}{11}$$

$$= 45\frac{5}{11}\%$$

30. (4) Let the initial value be A .

When it is increased by $r\%$ it becomes :

$$A + r\% \text{ of } A = \frac{A(r + 100)}{100}$$

Now, when it is decreased by $r\%$, it becomes

$$\frac{A(r + 100)}{100} - r\% \text{ of}$$

$$\begin{aligned} & \frac{A(r+100)}{100} \\ &= \frac{A(r+100)}{100} \left(1 - \frac{r}{100}\right) \\ &= \frac{A(r+100)(100-r)}{10000} \\ \therefore A \left(\frac{10000-r^2}{10000} \right) &= 1 \\ \Rightarrow A &= \frac{10000}{(10000-r^2)} \end{aligned}$$

31. (4) $y = \frac{110}{100} \times 125 = 137.5$

$\therefore x = 90\%$ of y

$$= \frac{90 \times 137.5}{100} = 123.75$$

32. (4) Error = 5.5 minutes

\therefore Error per cent

$$= \frac{5.5}{3 \times 60 + 40} \times 100 = 2.5 \text{ per cent}$$

33. (2) Per cent of families having either a cow or a buffalo or both = $60 + 30 - 15 = 75$

It means 25 per cent of families do not have a cow or a buffalo.

\therefore Required number of families

$$= 25\% \text{ of } 96 = 96 \times \frac{25}{100} = 24$$

34. (3) Let the amount invested at 6% = ₹ x

\therefore Amount invested at 5%

= ₹ $(10000 - x)$

According to the question,

$$\frac{(10000 - x) \times 5}{100} - \frac{x \times 6}{100} = 76.50$$

$$\Rightarrow 50000 - 5x - 6x = 7650$$

$$\Rightarrow 50000 - 11x = 7650$$

$$\Rightarrow 11x = 50000 - 7650 = 42350$$

$$\Rightarrow x = \left(\frac{42350}{11} \right) = ₹ 3850$$

35. (1) Kites of ₹ 20 are available for ₹ 19.

Hence, discount = 5%

i.e. $\frac{1}{20} \times 100$

If one gets kites of ₹ 20 for ₹ 18, discount = 10%

\therefore Required answer

20 kites \rightarrow 2 kites

$$27 \text{ kites} \rightarrow = \frac{2}{20} \times 27 \approx 3$$

36. (3) First part = ₹ x and second part = ₹ y .

According to question,

$$\frac{x \times 80}{100} = \frac{y \times 60}{100} + 3$$

$$\Rightarrow \frac{4x}{5} = \frac{3y}{5} + 3$$

$$\Rightarrow 4x - 3y = 15 \quad \dots(i)$$

Again,

$$\frac{4y}{5} = \frac{9x}{10} + 6$$

$$\Rightarrow 8y = 9x + 60$$

$$\Rightarrow 8y - 9x = 60 \quad \dots(ii)$$

By equation (i) $\times 8 +$ (ii) $\times 3$,

$$32x - 24y = 120$$

$$24y - 27x = 180$$

$$5x = 300 \Rightarrow x = 60$$

From equation (i)

$$4 \times 60 - 3y = 15$$

$$\Rightarrow 3y = 240 - 15 = 225$$

$$\Rightarrow y = \frac{225}{3} = 75$$

$$\therefore x + y = 60 + 75 = 135$$

37. (2) Value of ₹ 100 stock = ₹ 108

\therefore Income on investing ₹ 108 = ₹

$$\frac{25}{2}$$

\therefore Income on investment of ₹ 27000

$$= ₹ \left(\frac{25}{2 \times 108} \times 27000 \right)$$

$$= ₹ 3125$$

\therefore Gain per cent

$$= \frac{3125}{27000} \times 100$$

$$= \frac{625}{54} = 11 \frac{31}{54} \%$$

38. (3) Required mass of lead

$$= 8000 \times \frac{60}{100} \times \left(1 - \frac{3}{400} \right)$$

$$= 8000 \times \frac{60}{100} \times \frac{397}{400}$$

$$= 4764 \text{ kg.}$$

39. (4) According to the question,

$$x + y = (x^2 + y^2) \times \frac{1}{5}$$

Again, $x + y = (x^2 - y^2) \times \frac{1}{4}$

$$\therefore \frac{x^2 + y^2}{5} = \frac{x^2 - y^2}{4}$$

$$\Rightarrow 5x^2 - 5y^2 = 4x^2 + 4y^2$$

$$\Rightarrow 5x^2 - 4x^2 = 5y^2 + 4y^2$$

$$\Rightarrow x^2 = 9y^2$$

$$\Rightarrow x = 3y$$

$$\therefore \frac{x+y}{x^2} = \frac{x^2+y^2}{5x^2}$$

$$= \frac{9y^2+y^2}{5 \times 9y^2} = \frac{10y^2}{45y^2} = \frac{2}{9}$$

After giving 80% of eggs to the neighbour,

$$\text{Remaining eggs} = \frac{9x \times 20}{10 \times 100}$$

$$= \frac{9x}{50}$$

According to the question,

$$\Rightarrow x \times \frac{5}{4} \times \frac{24}{25} \times \frac{5}{4} \times \frac{24}{25} \times \frac{5}{4} = 72000$$

EXPLANATIONS

1. (1) Clearly, if the car is valued at Rs. 90 in 2000, it was valued at Rs. 100 in 1999.

∴ Value of the car in 1999

$$= \frac{145800 \times 100}{90}$$

In this way, value of car in 1997

$$= \frac{145800 \times 100 \times 100 \times 100}{90 \times 90 \times 90}$$

= Rs. 200000

2. (3) Percentage of students failed only in :

Physics = 42 - 14 = 28

Chemistry = 24 - 14 = 10

∴ Percentage of students who failed in Physics or Chemistry or both = 28 + 10 + 14 = 52

∴ Percentage of candidates who passed = 100 - 52 = 48

If the total number of students be x, then

$$x \times \frac{48}{100} = 72$$

$$\Rightarrow x = \frac{72 \times 100}{48} = 150$$

3. (2) Number of successful students :

$$\text{First Year} \Rightarrow \frac{7x \times 75}{100} = \frac{21x}{4} = 5.25x$$

$$\text{Second year} \Rightarrow \frac{8x \times 87.5}{100} = 7x$$

$$\text{Third year} \Rightarrow \frac{10x \times 93.75}{100}$$

= 9.375x

Total successful students

= 21.625x

Required percentage

$$= \frac{21.625x}{25x} \times 100 = 86.5\%$$

4. (4) In 100 gm of alloy, Copper = 89 gm.
Let x gm. of copper be mixed.

$$\frac{89+x}{11} = \frac{90}{10}$$

$$\Rightarrow x = 99 - 89 = 10\text{gm}$$

To get 44 kg of new alloy, copper to be mixed

$$= \frac{44 \times 1000 \times 100}{1100} = 4 \text{ kg.}$$

5. (1) Let original fraction be $\frac{x}{y}$.

$$\therefore \frac{x \times 250}{y \times 400} = \frac{5}{18}$$

$$\Rightarrow \frac{x}{y} = \frac{5}{18} \times \frac{400}{250} = \frac{4}{9}$$

6. (3) In original alloy,

Gold = 40 gm

Silver = 10 gm

Let x gm of gold is added.

$$\therefore \frac{40+x}{50+x} = \frac{90}{100} = \frac{9}{10}$$

$$\Rightarrow 400 + 10x = 450 + 9x$$

$$\Rightarrow x = 50 \text{ gm.}$$

7. (3) $\frac{A \times 5}{100} = \frac{B \times 15}{100}$

$$\Rightarrow \frac{A}{B} = \frac{15}{5} = \frac{3}{1}$$

$$\text{Again, } \frac{B \times 10}{100} = \frac{C \times 20}{100}$$

$$\Rightarrow \frac{B}{C} = \frac{2}{1}$$

$$\therefore A : B = 3 : 1 = 6 : 2$$

$$B : C = 2 : 1$$

$$\therefore A : B : C = 6 : 2 : 1$$

$$\therefore \text{Total income} = 9 \times 2000$$

$$= \text{Rs. 18000}$$

8. (1) If the number of women be x, then men = 10000 - x

$$\therefore \frac{x \times 6}{100} + \frac{(10000 - x) \times 5}{100}$$

$$= 10540 - 10000 = 540$$

$$\Rightarrow 6x + 50000 - 5x = 54000$$

$$\Rightarrow x = 4000$$

9. (1) Original price of wheat = Rs. x /kg.

$$\text{New price} = \text{Rs. } \frac{79x}{100} \text{ per kg}$$

$$\therefore \frac{100}{\frac{79x}{100}} - \frac{100}{x} = 10.5$$

$$\Rightarrow 100 \left(\frac{100 - 79}{79x} \right) = 10.5$$

$$\Rightarrow 100 \times 21 = 10.5 \times 79x$$

$$\Rightarrow \frac{79x}{100} = \frac{21}{10.5} = \text{Rs. 2.50 per kg}$$

- 10.** (3) Total marks obtained
= 25 + 30 + 70 = 125

- 11.** (3) If the number be x , then

$$\frac{x}{2} - 50 = 50$$

$$\Rightarrow \frac{x}{2} = 100$$

$$\Rightarrow x = 200$$

- 12.** (1) Total profit = ₹ 60000
Amount reinvested in business
= 40% of ₹ 60000
= ₹ 24000
Remaining amount of the profit
= 60% of ₹ 60000
= ₹ 36000
Bonus to employees
= 30% of ₹ 36000
= ₹ 10800
Donation for charity
= 20% of ₹ 36000 = ₹ 7200
Amount spent on advertisement
= ₹ (36000 - 10800 - 7200)
= ₹ 18000

- 13.** (2) Let the total number of students be x .
Given, Number of boys

$$= \frac{60}{100}x, \quad \dots\dots\dots (i)$$

$$\text{Number of girls} = 460$$

$$\Rightarrow \text{Number of boys} = x - 460$$

$$\dots\dots\dots (ii)$$

From equations (i) and (ii),

$$\Rightarrow x - 460 = \frac{60x}{100}$$

$$\Rightarrow 460 = \frac{40}{100}x$$

$$\Rightarrow x = \frac{460 \times 100}{40} = 1150$$

$$\therefore \text{Number of boys} = 1150 - 460 = 690.$$

- 14.** (3) Let the total output be x tonnes.

Then, net output

$$= x - \frac{24}{100}x = \frac{76x}{100}$$

$$\Rightarrow \frac{76}{100}x = 68,400$$

$$\Rightarrow x = \frac{68,400 \times 100}{76}$$

$$= 90,000 \text{ tonnes.}$$

- 15.** (4) Let the salary of B = ₹ 100.
Then, salary of A

$$= 100 + \frac{50}{100} \times 100 = \text{₹. 150}$$

\therefore B's salary is ₹ 50 less than A's salary.

\therefore Percentage of B's income less

$$\text{than A} = \frac{50}{150} \times 100$$

$$= \frac{100}{3} = 33\frac{1}{3}\%$$

Hence, B's salary is less than A's salary by 33.3%.

- 16.** (1) 100 gm quicklime contains oxygen = 28.6 gm.

\therefore 1 gm quicklime contains oxy-

$$\text{gen} = \frac{28.6}{100}$$

Hence, 750 gm quicklime contains

$$\text{oxygen} = \frac{28.6}{100} \times 750$$

$$= 214.5 \text{ gm.}$$

Hence, weight of oxygen in 750 gm quicklime is 214.5 gm.

- 17.** (2) Let the price of commodity be ₹ x per kg.

Increase in price = 60%

\therefore Increased price of 1 kg

$$= \text{₹ } 1.6x$$

If ₹ 1.6 x is price of 1 kg

$$x \text{ is price of } \frac{x}{(1.6)x} = \frac{10}{16} \text{ kg}$$

\therefore In order to keep the expenditure same, consumption should be reduced by

$$1 - \frac{10}{16} = \frac{16 - 10}{16} = \frac{6}{16} \text{ kg}$$

Percentage reduction in consumption

$$= \frac{6}{16} \times 100 = \frac{75}{2} = 37.5\%$$

- 18.** (3) Let the total salary of each of them = ₹ x .

$$\text{Sohan saves} = \text{₹. } \frac{14}{100}x$$

and George saves

$$= \frac{22}{100}x = 1540$$

$$\Rightarrow x = \text{₹ } 7000$$

$$\therefore \text{Sohan saves} = \frac{14}{100} \times 7000$$

$$= \text{₹ } 980$$

- 19.** (4) Let the maximum marks be x .

A student scored = $\frac{30}{100}x$, and failed by 12 marks.

$$\therefore \text{Passing marks} = \frac{30}{100}x + 12$$

$$\text{Another student scored} = \frac{40}{100}x$$

and got 28 marks more than passing marks.

$$\therefore \text{Passing marks} = \frac{40}{100}x - 28$$

$$\Rightarrow \frac{30}{100}x + 12 = \frac{40}{100}x - 28$$

$$\Rightarrow \frac{10}{100}x = 40 \Rightarrow x = 400$$

\therefore Maximum marks = 400

Hence, Passing marks

$$= \frac{30}{100} \times 400 + 12 = 132$$

\therefore Pass percentage

$$= \frac{132}{400} \times 100 = 33\%$$

The pass percentage = 33%

- 20.** (1) Let the total number of votes cast = x .

Number of votes got by

$$A = \frac{65}{100}x \quad \dots\dots\dots (i)$$

\Rightarrow B got

$$= x - \frac{65}{100}x = \frac{100x - 65x}{100} = \frac{35}{100}x$$

A won the election by 2748 votes.

\therefore Number of votes for A

$$= \frac{35}{100}x + 2748 \quad \dots\dots\dots (ii)$$

Form equations (i) and (ii),

$$\Rightarrow \frac{65}{100}x = \frac{35}{100}x + 2748$$

$$\Rightarrow \frac{30x}{100} = 2748$$

$$\Rightarrow x = \frac{2748 \times 100}{30} = 9160$$

\therefore Total number of votes cast = 9160

- 21.** (2) Suppose the maximum marks = 100

\therefore Marks required to pass = 40

\therefore A gets 10% less than pass marks.

\therefore Marks secured by

$$A = \frac{40 \times 90}{100} = 36$$

\therefore B gets $11\frac{1}{9}\%$ marks less than A.

\therefore Marks secured by B

$$= \frac{36 \times \left(100 - 11\frac{1}{9}\right)}{100}$$

$$= \frac{36 \times \left(\frac{900 - 100}{9}\right)}{100}$$

$$= 36 \times \frac{800}{9} \times \frac{1}{100} = 32$$

Total marks obtained by A and B = $36 + 32 = 68$

\therefore C gets $41\frac{3}{17}\%$ marks less than the marks obtained by A and B together.

\therefore C's marks

$$= \frac{68 \times \left(100 - 41\frac{3}{17}\right)}{100}$$

$$= \frac{68 \times \left(100 - \frac{700}{17}\right)}{100}$$

$$= \frac{68 \times \frac{1000}{17}}{100}$$

$$= 68 \times \frac{1000}{17} \times \frac{1}{100} = 40$$

- 22.** (3) Let the original price be ₹ x per kg.

$$\text{Reduction in price} = ₹ \frac{25}{100}x$$

$$\therefore \text{Reduced price} = x - \frac{25}{100}x$$

$$= \frac{75}{100}x \quad \dots (i)$$

With ₹ 240, purchaser can purchase 2 kg more apples.

Now, 25% of 240

$$= \frac{25}{100} \times 240 = ₹ 60$$

\Rightarrow Reduced price of 2 kg of apples = Rs. 60

\therefore Reduced price of 1 kg of apples = ₹ 30 $\dots (ii)$

From equations (i) and (ii),

$$\frac{75}{100} \times x = 30$$

$$\Rightarrow x = \frac{30 \times 100}{75} = ₹ 40$$

The original price of 1 kg apples = Rs. 40.

- 23.** (4) Let the total number of soldiers in all in the army in the beginning = 100.

\therefore Number of soldiers killed in the battle

$$= \frac{10}{100} \times 100 = 10$$

\therefore Remaining soldiers

$$= 100 - 10 = 90$$

Number of soldiers who died of

$$\text{disease} = \frac{10}{100} \times 90 = 9$$

\therefore Remaining soldiers = $90 - 9 = 81$

Number of disabled soldiers

$$= \frac{10}{100} \times 81 = \frac{81}{10}$$

\therefore Remaining soldiers

$$= 81 - \frac{81}{10} = \frac{810 - 81}{10} = \frac{729}{10}$$

\therefore If $\frac{729}{10}$ soldiers are left, then

total number of soldiers = 100

\therefore If 1 soldier is left, then total number of soldiers

$$= \frac{100 \times 10}{729}$$

\therefore If 729000 soldiers are left, then total number of soldiers

$$= \frac{100 \times 10 \times 729000}{729} = 1000000$$

- 24.** (2) Let the salary be ₹ 100. Then, House rent = ₹ 10; Balance = ₹ $(100 - 10) = ₹ 90$.

Expenditure on children's education = 15% of ₹ 90

$$= \frac{15 \times 90}{100} = ₹ \frac{27}{2}$$

$$\text{Balance now} = \left(90 - \frac{27}{2}\right)$$

$$= \left(\frac{180 - 27}{2}\right) = ₹ \frac{153}{2}$$

Expenditure on clothes

$$= \left(10\% \text{ of } \frac{153}{2}\right) = ₹ \left(\frac{153}{20}\right)$$

Now, balance

$$= \left(\frac{153}{2} - \frac{153}{20}\right) = ₹ \frac{1377}{20}$$

If last balance is ₹ $\frac{1377}{20}$, then

salary = ₹ 100.

If last balance is ₹ 2754, then salary

$$= ₹ \left(\frac{100 \times 20}{1377} \times 2754\right) = ₹ 4000.$$

- 25.** (3) Let the original consumption be 1 unit & tax on it be ₹ 100. So, revenue = ₹ $(100 \times 1) = ₹ 100$. New consumption

$$= \left(\frac{110}{100} \times 1\right) = \frac{11}{10} \text{ units.}$$

Now, tax on 1 unit = ₹ 90

Tax on $\frac{11}{10}$ units

$$= \left(90 \times \frac{11}{10}\right) = ₹ 99.$$

\therefore Decrease in revenue = 1 %.

- 26.** (4) Suppose total number of votes cast = x .

\therefore Number of illegal votes = 4%

$$\text{of } x = \frac{4x}{100} = \frac{x}{25}$$

\therefore Number of valid votes

$$= x - \frac{x}{25} = \frac{25x - x}{25} = \frac{24x}{25}$$

Votes secured by the contestant who is defeated

$$= \frac{24x}{25} - \frac{24x}{25} \times \frac{55}{100}$$

$$= \frac{24x}{25} \left(1 - \frac{55}{100}\right) = \frac{24x}{25} \times \frac{45}{100}$$

According to the question,

$$\frac{24x}{25} \times \frac{55}{100} - 240 = \frac{24x}{25} \times \frac{45}{100}$$

$$\Rightarrow \frac{24x}{25} \left(\frac{55}{100} - \frac{45}{100}\right) = 240$$

$$\Rightarrow \frac{24x}{25} \cdot \frac{10}{100} = 240$$

$$\Rightarrow \frac{24x}{250} = 240$$

$$\Rightarrow x = \frac{250 \times 240}{24} = 2500$$

\therefore Total number of votes cast = 2500
